The second half of the 20th century and the beginning of the 21st century witnessed important changes in ecology, climate and human behaviour that favoured the development of urban pests. Most alarmingly, urban planners now face the dramatic expansion of urban sprawl, in which city suburbs are growing into the natural habitats of ticks, rodents and other pests. Also, many city managers now erroneously assume that pest-borne diseases are relics of the past. All these changes make timely a new analysis of the direct and indirect effects of present-day urban pests on health. Such an analysis should lead to the development of strategies to manage them and reduce the risk of exposure. To this end, WHO invited international experts in various fields - pests, pest-related diseases and pest management - to provide evidence on which to base policies. These experts identified the public health risk posed by various pests and appropriate measures to prevent and control them. This book presents their conclusions and formulates policy options for all levels of decision-making to manage pests and pest-related diseases in the future. [Ed.]

In the fall of 1992, in a small room in Boston, MA, an extraordinary meeting took place. For the first time, the sons and daughters of Holocaust victims met face-to-face with the children of Nazis for a fascinating research project to discuss the intersections of their pasts and the painful legacies that history has imposed on them. Taking that remarkable gathering as its starting point, Justice Matters illustrates how the psychology of hatred and ethnic resentments is passed from generation to generation. Psychologist Mona Weissmark, herself the child of Holocaust survivors, argues that justice is profoundly shaped by emotional responses. In her in-depth study of the legacy encountered by these children, Weissmark found, not surprisingly, that in the face of unjust treatment, the natural response is resentment and deep anger-and, in most cases, an overwhelming need for revenge. Weissmark argues that, while legal systems offer a structured means for redressing injustice, they have rarely addressed the emotional pain, which, left unresolved, is then passed along to the next generation-leading to entrenched ethnic tension and group conflict. In the grim litany of twentieth-century genocides, few events cut a broader and more lasting swath through humanity than the Holocaust. How then would the offspring of Nazis and survivors react to the idea of reestablishing a relationship? Could they talk to each other without open hostility? Could they even attempt to imagine the experiences and outlook of the other? Would they be willing to abandon their self-definition as aggrieved victims as a means of moving forward? Central to the perspectives of each group, Weissmark found, were stories, searing anecdotes passed from parent to grandchild, from aunt to nephew, which personalized with singular intensity the experience. She describes how these stories or "legacies" transmit moral values, beliefs and emotions and thus freeze the past into place. For instance, cdxmerged that most children of Nazis reported their parents told them stories about the war whereas children of survivors reported their parents told them stories about the Holocaust. The daughter of a survivor said: "I didn't even know there was a war until I was a teenager. I didn't even know fifty million people were killed during the war I thought just six million Jews were killed." While the daughter of a Nazi officer recalled: "I didn't know about the concentration-camps until I was in my teens. First I heard about the [Nazi] party. Then I heard stories about the war, about bombs falling or about not having food." At a time when the political arena is saturated with talk of justice tribunals, reparations, and revenge management, Justice Matters provides valuable insights into the aftermath of ethnic and religious conflicts around the world, from Rwanda to the Balkans, from Northern Ireland to the Middle East. The stories recounted here, and the lessons they offer, have universal applications for any divided society determined not to let the ghosts of the past determine the future.

In this Special Issue on human health engineering, we invited submissions exploring recent contributions to the field of human health engineering, which is the technology used for monitoring the physical or mental health status of individuals in a variety of applications. Contributions focused on sensors, wearable hardware, algorithms, or integrated monitoring systems. We organized the different papers according to their contributions to the main aspects of the monitoring and control engineering scheme applied to human health applications, including papers focusing on measuring/sensing physiological variables, contributions describing research on the modelling of biological signals, papers highlighting health monitoring applications, and finally examples of control applications for human health. In comparison to biomedical engineering, the field of human health engineering also covers applications on healthy humans (e.g., sports, sleep, and stress) and thus not only contributes to develop technology for curing patients or supporting chronically ill people, but also more generally for disease prevention and optimizing human well-being.
