The new bleed screw is located at the highest point in the coolant system! With the engine hot and running, I opened the new bleed screw using the two wrenches (10 mm to hold the fitting and 7 mm to open the bleed screw) til coolant came through and the engine was bled properly. I'll run it for a couple of days and bleed it again. So far so good.

By driving it without enough coolant you probably put air in the system. Since you have a gallon of 100% Id just fill with water. Fill until at the normal level, then start it and put the heat on high. Add water until at the OK level. These engines are known for intake manifold gaskets leaking coolant into the intake.

Then the old coolant is forced out of the cooling system. Keep in mind that when the engine is running, the water pump is going to have an opinion on which way the water flows. Prior to the flush, I put the hose on low pressure, with the engine off. That makes it much easier to catch the old coolant in a 5 gallon bucket.
