High-performance liquid chromatography ( HPLC ), formerly referred to as high-pressure liquid chromatography, is a technique in analytical chemistry used to separate, identify, and quantify each component in a mixture. It relies on pumps to pass a pressurized liquid solvent containing the sample mixture through a column filled with a solid adsorbent material.

### High-performance liquid chromatography - Wikipedia

HPLC Introduction. HPLC stands for High-Performance Liquid Chromatography. Before HPLC was available, LC analysis was carried by the gravitational flow of the eluent (the solvent used for LC analysis) thus required several hours for the analysis to be completed. Even the improvements added in later time we're able to shorten the analysis time slightly.

## Brief Introduction of HPLC | GALAK Chromatography Technology

An Introduction to High Performance Liquid Chromatography  
High Performance Liquid Chromatography, or HPLC, is the most common analytical separation tool and is used in many aspects of drug manufacture and research. HPLC is used for: 1. Qualitative and quantitative analysis of unknown mixtures – determining what is there, and how much.

An Introduction to High Performance Liquid Chromatography  
Reversed-phase chromatography is the most commonly used HPLC separation mode. It is far superior to the other modes in the variety of target compounds it can handle. The dominant phenomenon

retaining the sample in the column in reversed-phase chromatography is the hydrophobic interaction between the solid phase and sample. Two

## Introduction to HPLC

The acronym HPLC, coined by the late Prof. Csaba Horváth for his 1970 Pittcon paper, originally indicated the fact that high pressure was used to generate the flow required for liquid chromatography in packed columns. In the beginning, pumps only had a pressure capability of 500 psi [35 bar].

## HPLC injection: The technique and instrumentation

HPLC is a technique that employs a liquid mobile phase. Stationary phases are typically chemically modified inorganic silicas or polymeric beads packed into a column. In HPLC, the separation mechanism that partitions components of a sample between the two phases can take many forms, depending on the nature of the samples and the phases employed.
