

Ball And Beam 1 Basics Control Systems Principles

Thank you entirely much for downloading **ball and beam 1 basics control systems principles**. Maybe you have knowledge that, people have see numerous period for their favorite books subsequent to this ball and beam 1 basics control systems principles, but end up in harmful downloads.

Rather than enjoying a fine PDF following a mug of coffee in the afternoon, then again they juggled bearing in mind some harmful virus inside their computer. **ball and beam 1 basics control systems principles** is friendly in our digital library an online entrance to it is set as public for that reason you can download it instantly. Our digital library saves in combination countries, allowing you to acquire the most less latency period to download any of our books similar to this one. Merely said, the ball and beam 1 basics control systems principles is universally compatible with any devices to read.

The ball and beam system consists of a long beam which can be tilted by a servo or electric motor together with a ball rolling back and forth on top of the beam. It is a popular textbook example in control theory . The significance of the ball and beam system is that it is a simple system which is open-loop unstable .

Physical setup. A ball is placed on a beam, see figure below, where it is allowed to roll with 1 degree of freedom along the length of the beam. A lever arm is attached to the beam at one end and a servo gear at the other. As the servo gear turns by an angle , the lever changes the angle of the beam by . When the angle is changed from the horizontal position, gravity causes the ball to roll along the beam.

The ball and beam system is a popular textbook example in control theory and nonlinear dynamics. Find this and other hardware projects on Hackster.io.

Ball and Beam - LabVIEW Projects

This was a school project, the assignment was to construct a ball and beam control system. A ping pong ball sits on top of the beam rolling forwards and backwards according to the pitch of the beam. The pitch is controlled by a servo that is connected to an Arduino. The position of the ball is measured by a distance sensor mounted at the end of the beam. An PID controller is used to control the position of the ball on the beam.

A ball is placed on a beam, see figure below, where it is allowed to roll with 1 degree of freedom along the length of the beam. A lever arm is attached to the beam at one end and a servo gear at the other. As the servo gear turns by an angle theta, the lever changes the angle of the beam by alpha.
