We know racism is entrenched in our systems and institutions, but what about our cities and public spaces? In The Diaspora of Belonging, author Jay Sharma explores the history of systemic racism, structural oppression, and state-sanctioned discrimination and injustice as it relates to urban settings. Drawing on 12 unique cities across the country, Sharma demonstrates how calculated decisions regarding our cities are, and how those in power have weaponized the built environment for decades. Covering topics that range from residential segregation, zoning, suburbanization, and urban renewal to ghettoization, immigration, deindustrialization, the tech industry, and more, The Diaspora of Belonging makes it ardently clear that America has always neglected to make inclusive spaces. Perhaps more importantly, it dissects the collective disdain for gentrification, and highlights the pervasiveness of poverty in America. Explore the connections between justice and design, economics and identity, and segregation and community in The Diaspora of Belonging. Let it challenge and inspire you to make our cities and neighborhoods better places for us all.

Most decisions and plans in a firm require a forecast. Not matching supply with demand can make or break any business, and that's why forecasting is so invaluable. Forecasting can appear as a frightening topic with many arcane equations to master. For this reason, the authors start out from the very basics and provide a non-technical overview of common forecasting techniques as well as organizational aspects of creating a robust forecasting process. The book also discusses how to measure forecast accuracy to hold people accountable and guide continuous improvement. This book does not require prior knowledge of higher mathematics, statistics, or operations research. It is designed to serve as a first introduction to the non-expert, such as a manager overseeing a forecasting group, or an MBA student who needs to be familiar with the broad outlines of forecasting without specializing in it.

This book is for everyone who wants to make better forecasts. It is not about mathematics and statistics. It is about following a well-established forecasting process to create and implement good forecasts. This is true whether you are forecasting global markets, sales of SKUs, competitive strategy, or market disruptions. Today, most forecasts are generated using software. However, no amount of technology and statistics can compensate for a poor forecasting process. Forecasting is not just about generating a number. Forecasters need to understand the problems they are trying to solve. They also need to follow a process that is justifiable to other parties and be implemented in practice. This is what the book is about. Accurate forecasts are essential for predicting demand, identifying new market opportunities, forecasting risks, disruptions, innovation, competition, market growth and trends. Companies can navigate this daunting landscape and improve their forecasts by following some well-established principles. This book is written to provide the fundamentals business leaders need in order to make good forecasts. These fundamentals hold true regardless of what is being forecast and what technology is being used. It provides the basic foundational principles all companies need to achieve competitive forecast accuracy.
