8086 Introduction In 1978, Intel introduced the x86 instruction set architecture (ISA) which was the successor of the 8088 microprocessors. It was the first microprocessor-based computing architecture developed in the IA family. After that, Intel developed other microprocessors like 80186, 80286, 80386, Core 2 and Pentium series, etc.

General purpose registers- 8086 microprocessor has four 16 bit general purpose registers AX, BX, CX and DX. These are available to the programmer for storing values during programs. Each of these can be divided into two 8 bit registers such as AH, AL; BH, BL; etc. Beside their general use, these registers also have some specific functions.

The Intel 8088, released July 1, 1979, is a slightly modified chip with an external 8-bit data bus (allowing the use of cheaper and fewer supporting ICs), and is notable as the processor used in the original IBM PC design. The 8086 gave rise to the x86 architecture, which eventually became Intel's most successful line of processors.
