nutritional disorders, side effects of chemotherapy and radiation, and other diagnostic and therapeutic procedures and concludes with a discussion on paraneoplastic syndromes."

Clifford B. Saper, Chair of Neurology at Harvard Medical School, and Nicholas D. Schiff of Weill Medical College in NY join the original authors to thoroughly update this seminal text with over 90% new material. the goal of the new edition is to provide a clinically slanted volume that will help the reader understand and diagnose severe brain dysfunction both as it exists and as it evolves in the seriously ill. the book remains a treatise on pathophysiology because recent

Neurology, imaging, electrophysiologic, and biochemical technologies (discussed in the book) are by themselves insufficient substitute

The Neurology of Eye Movements provides clinicians with a synthesis of current scientific information that can be applied to the diagnosis and treatment of disorders of ocular motility. Basic scientists will also benefit from descriptions of how data from anatomical, electrophysiological, pharmacological, and imaging studies can be directly applied to the study of disease. By critically reviewing such basic studies, the authors build a conceptual framework that can be applied to the interpretation of abnormal ocular motor behavior at the

bedside. These syntheses are summarized in displays, new figures, schematics and tables. Early chapters discuss the visual need and neural basis for each functional class of eye movements. Two large chapters deal with the evaluation of double vision and systematically evaluate how many disorders of the central nervous system affect eye movements. This edition has been extensively rewritten, and contains many new figures and an up-to-date section on the treatment of abnormal eye movements such as nystagmus. A major innovation has been the development of an option to read the book from a compact disc, make use of hypertext links (which bridge basic science to

serologic diagnostic tests are discussed. Sections are devoted to nerve and skin biopsy techniques and findings, quantitative sensory and autonomic reflex tests. Case examples are used liberally throughout the text. The editors: Mendell, Kissel, and Cornblath are experienced clinicians that bring complementary knowledge to each of the subjects. Additional authors have been handpicked for specific topics which add to the value of the edition.

Contemporary Neurology compiles a large series of papers on the commonest neurological problems. This book discusses the management of epilepsy, involuntary movements, nerve

Neurology/Psychiatry "Boards .

This second edition of 'Seizures and Epilepsy' is completely revised, due to tremendous advances in the understanding of the fundamental neuronal mechanisms underlying epileptic phenomena, as well as current diagnosis and treatment, which have been heavily influenced over the past several decades by seminal neuroscientific developments, particularly the introduction of molecular neurobiology, genetics, and modern neuroimaging. This resource covers a broad range of both basic and clinical epileptology.

the latest scientific understanding of spinal cord injury (SCI), focusing on the mechanisms causing paralysis after spinal cord trauma, the molecular determinants of neural regeneration, and methods for improving damaged function. The authors examine the role of intracellular Ca^{2+} in neuronal death, the possibility of spinal learning, growth-promoting molecules for regenerating neurons, and the biochemistry and cell biology of microtubules. Among the treatment possibilities discussed are cell transplantation strategies beyond the use of fetal spinal cord tissue, remyelination in spinal cord demyelination models, high steroid therapy immediately after SCI, and the

ICU and their work with patients in acute, life-threatening situations who are dealing with neurologic or neurosurgical crises emanating from either a preexisting neurologic syndrome or from a new neurologic complication appearing as a result of another medical or surgical critical illness. These two separate clinical situations form the pillars of neurocritical care, hence these practices are addressed via two separate, but closely related, HCN volumes. Chapters in both focus on pathophysiology and management, and are tailored for both general neurologists and active neurocritical specialists, with a specific focus on management over diagnostics.

Bookmark File PDF Journal Of Contemporary

Part I addresses the principles of neurocritical care and the management of various neurologic diseases. Part II addresses the interplay between neurologic complications and the surgical, medical, cardiac, and trauma of critical illnesses that most typically present in the ICU. Provides an essential neurocritical care overview for general neurologists Presents neurocritical care specialists with an update on severe neurological illness management Offers coverage of all the most frequent neurologic diseases requiring intensive care Includes chapters authored by global leaders in the field, providing the broadest, most expert coverage available on the topics discussed
